

Aricks dispatch to Russia

LOADED FOR DELIVERY: Colin Wemyss with the Aricks Australia wheels bound for Russia, adding to a strong and growing export market for the Corowa business.

ARICKS Australia will dispatch their first major shipment of wheels to Russia in 2016.

Destined for the Siberian region, eight crates of residue managers from Corowa will start their journey this week with what is hoped will be the start of a regular supply.

Aricks Australia (formerly BPR Engineering) logistics and marketing liaison officer Jacqui Wemyss said Aricks have been building residue managers since 2008 and have been expanding their market base into Switzerland, the UK, France, South Africa, USA, Canada, Kenya and New Zealand over the past two years.

Managing director Colin Wemyss said there were in excess of 7000 residue managers in use in Australia.

"We have recently upgraded the composition to a cast version with new heavy duty components and a streamlined body to combat space limitations and reduce the protrusion factor," he said.

Aricks Australia specialise in maintenance to John Deere disc seeders including re-bushing opener pivots,

“The whole machine can be rebuilt without the need to remove the heavy, cumbersome disc opener, thanks to some specialised equipment, which saves time and money.

press and closing wheel pivots, unseizing gauge wheel shafts, installation of non-greasable bushes, aricks wheels, discs and mudsmith gauge wheels and supply and replacement of their extended wear seed boots.

"The whole machine can be rebuilt without the need to remove the heavy, cumbersome disc opener, thanks to some specialised equip-

ment, which saves time and money. Last year alone we serviced more than 40 disc machines across three states - QLD, NSW and Victoria. We have recently developed our own cast composite seed boot, which are manufactured using the strongest materials available and are genuine extended wear.

"The purpose manufactured shouldered bolts together with our seed boots reduces the vertical play often synonymous with these disc seeders, which will ensure correct seed placement."

Aricks are the sole agent in Australia for the mudsmith gauge wheels, an upgrade on the original John Deere gauge wheel, allowing sowing in sticky, muddy conditions without plugging of the wheel.

"The cast centre hub fully supports the bearing and solves bearing housing wear," said Colin.

Aricks Australia supply a vast range of European made discs, coulters and scalloped discs, manufactured from high quality spanish boron steel.
